

Layered Components Report

Brynlee Bingham

29 September 2026

Site Details

My live layered components page is at <https://brynbing03.github.io/wdd331/unit-2/layered-components/index.html> and the source code is at <https://github.com/Brynbing03/wdd331.git>.

Reflections

Layer Declaration with Vendor CSS

@layer reset, vendor, components, utilities
I think that I would put reset first because it handles the basic browser defaults and it gives the rest of the css a clean starting point. Then I think I would put vendor for any css that comes from the 3rd party library. I would want it close to the beginning so that my own styles could override it if I wanted it to. The components layer would contain the css I write for things like the nav, buttons, cards and forms. I think it should come after the vendor layer so my component styles have priority too over the library styles. Last I think I would put utilities because they are kind of like smaller helper classes that would want to be able to override the other styles without needing to use !important.

:is() vs :where()

I think that :is() and :where() are both really helpful when it comes to grouping selectors together so you don't have to repeat the same css over and over. It gets kinda annoying if you have to do that. I think that the main difference is that :is() keeps the specificity of the selectors inside it while :where() has none. If I was writing base styles that other devs might need to override later I would probably use :where(). I think it would make those base styles easier to go over with component classes without having to fight against the specificity.

Rethinking Unit 1

I think the one big that I would change from unit 1 is how I organized my css. In unit 1 I just had a lot of it all together in one place but after doing this assignment, I actually really liked having things split into different files. Sometimes I didn't know exactly where to go to change something specific, but once I figured that out it was great! I think I would keep my colors and variables in one file and then have separate files for other specific things like nav, cards, etc. This does mean that there will be more files to keep track of, but I think it is worth it in the big picture. I feel like it just makes everything easier to find and work with and I really liked it. :)
