Topic and Video

I chose to study and teach about: **Print and Forced Colors**. I have uploaded my video to **YouTube** and verified in a private browsing window that anyone with the link can view it without needing to request access or sign in.

You may view the video online at: https://youtu.be/Brdbo14aY8U.

Summary

Okay so for this week the topic I decided to learn about and teach is print and forced colors in CSS. I honestly never thought about how browsers change colors when someone prints a website or uses like high contrast setting so it was actually pretty cool to learn about. So I made a little website with chat to help demo everything and how it works. I went over print-color-adjust and the difference between economy and exact. I also showed how to use dev tools to turn on forced colors node and see how much it changes the website. One thing that I thought was interesting was how box shadows can disappear but if you just add a simple border it can fix it right up. I also showed how forced-color-adjust: none can help keep certain colors when there are actually important. I think the biggest thing that I took away from this is that even with little CSS changes can make a big difference with accessibility. I did learn that you can't always rely on colors or shadows to make things stand out. I think I will be more aware of this now when I do websites in the future.
