Architecture and Build Report

Brynlee Bingham October 6, 2026

Site Details

My live portfolio homepage is at https://brynbing03.github.io/wdd331/index.html and the source code is at https://github.com/Brynbing03/wdd331.

I chose **Lightning CSS** as my build tool for this assignment.

Reflection

Write a thoughtful response to each prompt. These are not summaries of what you did. They ask you to reason about why your architecture works the way it does and what would happen if it changed.

Layer Order

Okay so in my main.css I put my layers in this order: tokens, base, layout, components, and utilities. I chose this order because I felt like the layers built on each other and the one before it. The tokens hold things like my colors, spacing and fonts while the base layer uses those tokens for the basic styles of the page. The layout and components add more specific styling. I kind of like it and the idea I had. If I swapped the components and utilities layers I think it could change which styles win when they both affect the same element. Right now the utilities come late so a utility like .text-center can override a components normal test alignment when I want something specific centered. If components came after utilities the component styles could override that utility instead. I think that keeping it last makes them useful for small changes without having to rewrite a component itself.

Token Tracing

One token that I used was --color-primary which I defined in colors.css. It is used in files like elements.css and cards.css for the links and buttons. Hypothetically, if a teammate wanted to change it they would need to know that the token is shared across the website. Changing it in colors.css could affect multiple parts of the site so they would need to make sure the new color still looked good and make sure it is still easy to read. I think they would just have to be careful and check all the boxes before doing it.

Placement Decisions

I guess one rule I wasn't completely sure where to put was my .card styling. I wasn't sure if it should go in the layout folder because the cards are part of how the page is organized, or if it should be in components. I decided to put it in components/cards.css cause the card is its own reusable piece with its own background, padding, border and the other styles. If I realized later that those styles were controlling the overall page layout I think I would move those specific rules into the layout folder so it stayed organized and looking good.
