Reflection

Deriving Dark Mode Values

I personally think that using color-mix( ) to auto create dark mode colors would be really helpful cause it would save time and keep the colors more consistent. If I ever wanted to change my main color the other colors then could update automatically instead of me having to change each one which would be a little annoying. I also think that choosing the dark mode colors by hand gives me a little more control over how everything looks. Just because a color looks good in light mode definitely doesn't mean it will look good in dark mode. Some colors might be way too bright or hard to read. I think that using a mix of both of these methods is probably the best option cause then you get consistency but you can still make changed when you want to. I think they both have good things about them that can be utilized and used.

Understanding color-mix() Percentages

the percentage in color-mix( ) tells me how much of the specific color is being used in the mix I guess. So like when I use 30% of my orange seed color, the remaining 70% would be white. This just makes the final color much lighter because there is more white mixed in. Then I use 75% of my orange seed color then only 25% is white so the color looks stronger and closer to the original orange. I learned that the percentage isn't telling us how light or dark the color should be. It is actually telling us how much of each color is being mixed together. I thought this was kinda cool. :)

Looking Back

One thing I think I understand a lot better now is how CSS colors can work together as a whole system instead of just choosing random colors for different parts of a website. Before I guess I would just kind of pick colors that looked good and use them wherever I needed them. Now I have learned that using seed colors and semantic tokens makes everything more consistent and easier to change. I also learned that dark mode isn't just about make in the background dark. I have never been a dark mode girl so I actually learned more about this than I thought I ever would. When doing dark mode, you have to think about contrast, readability and how all the colors look together.. It was kinda cool to see how changing a few shared tokens could update all three of my portfolio pages. I had some hiccups with this but I finally got it figured out and got it working.
