Reflections

You used custom properties to define a small set of design tokens in your starter stylesheet. Imagine a teammate joins your project six months from now and needs to add a dark mode. Explain how the token structure you set up would help or hinder that effort, and what you would change:

The custom properties would make adding a dark mode a lot easier I think because the main colors are already saved in one place. Instead of going through the whole CSS file and changing every color, my teammate could just change the color variables for dark mode. As I continue working on the website, I think I would try to make sure all of my colors use custom properties. This would make it a lot easier in the long run to make changes later and keep everything consistent and looking good.

Look at the starter CSS you added to your portfolio. Identify one value that is still hard coded (not using a custom property) that probably should be a token. Explain why extracting it would matter in a larger project:

One value that is hard coded is the 1.6 line height. I think I could make this a custom property instead. This would be helpful as my website gets bigger because I could change the line spacing in one place instead of having to change it everywhere cause that would be a pain.

Browse one professional website you admire and open DevTools. Do they use custom properties? Describe what you found and one thing you would do differently based on what you learned this week:

I use a Mac so I decided to browse Apple's website. As I looked, I found that they do use custom properties in their CSS. They use them to help keep things like colors and styling consistent throughout the website so it looks uniform. One thing I learned is how helpful custom properties can be when there is a lot of CSS. I think I would try to use more custom properties in my own website as it grows so it is easier to make changes and keep everything consistent. I'm excited to try this and see how it changes the way I do things when it comes to styling and my personal CSS files. :)
