Grid Layouts Report

Brynlee Bingham October 27, 2026

Site Details

My live grid layouts pages are at https://brynbing03.github.io/wdd331/unit-4/grid-layouts/editorial.html and the source code is at https://github.com/Brynbing03/wdd331.git.

Reflections

Layout Tool Decisions

You are building a product page for a client. It needs a hero, a three-column feature section, a full-width testimonial band, and a two-column spec comparison. Walk through which layout tool you would reach for in each section and why. You cannot use the same justification twice.

Okay personally I think for the hero section I would probably use flexbox because it makes it easy to get the text and buttons where I would want them. For the three column feature I think I would used css grid so everything is spaced out evenly and it would look organized. For the testimonial section one I think I would use a regular block layout and make it take up the full width of the page. Then I think for the two column spec comparison I would use css grid again cause it would make it easier to line up the information side by side so people can compare things.

Responsive Areas

Your client comes back and says they want the editorial sidebar to move below the article on tablet but above it on mobile. What changes, and what stays the same? What does that tell you about how grid-template-areas distributes responsibility in a responsive layout?

I would just change the grid temple areas in my media queries so that the sidebar shows up above the article on mobile and then it would be below on tablet. I then wouldn't have to change the html or any of the actual content just some of the css. I think that is what makes grid template areas so nice cause you can move things around for different screen sizes without having to completely redo your page.

Mentoring a Junior Developer

A junior developer on your team always reaches for auto-fill instead of auto-fit because it is simpler to remember one keyword. What advice would you give them?

I think I would tell them that they are both very useful but it depends on what you're trying to do. Auto fill keeps space for extra columns even if there isn't anything in them, while auto fit lets the cards stretch out and fill up the extra space. I would probably recommend auto fit for something like our card grid that we did this week because it makes the layout look better when there are fewer cards. I think it is good to understand both too instead of just using the same one very time. More knowledge is better right? :)
